Soil Moisture Dynamics: A Comparison of the SMOS Satellite to the South Fork in-situ Soil Moisture Network

By: Wesley Rondinelli

Mentors:

Dr. Brian Hornbuckle

Dr. Michael Cosh

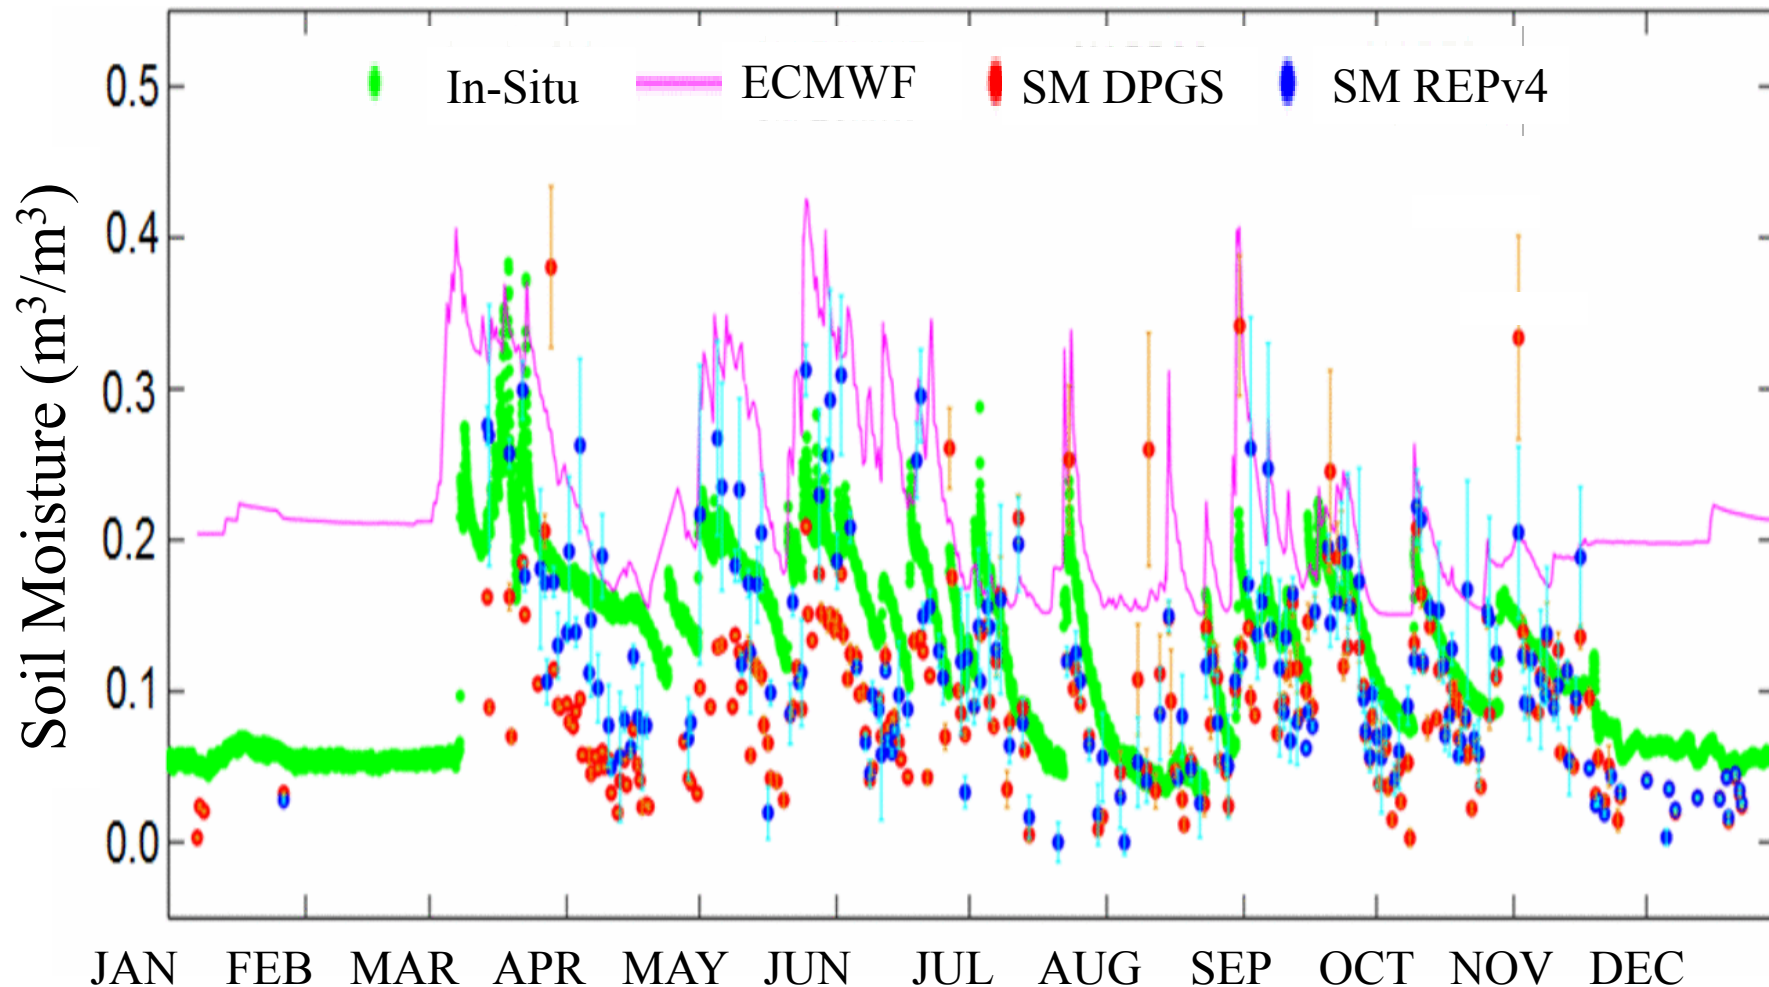

Jason Patton

Department of Geological and
Atmospheric Science, 2014

Symposium on Undergraduate
Research and Creative Expression

- Introduction
- Hypothesis
- Methods
- Results
- Analysis
- Conclusion

Why Study Soil Moisture

Why Study Soil Moisture

- Lack of Accuracy in Weather Models
- Hydrological Cycle
- Crop Forecasts
- Drought Monitoring
- Flood Control

Soil Moisture and Oceanic Salinity (SMOS) Satellite

- Soil Moisture from Surface to Approximately 3-5 cm
- Average 1-3 Day Cycle
- Passive Sensor
- 40 km Grid
- European Space Agency

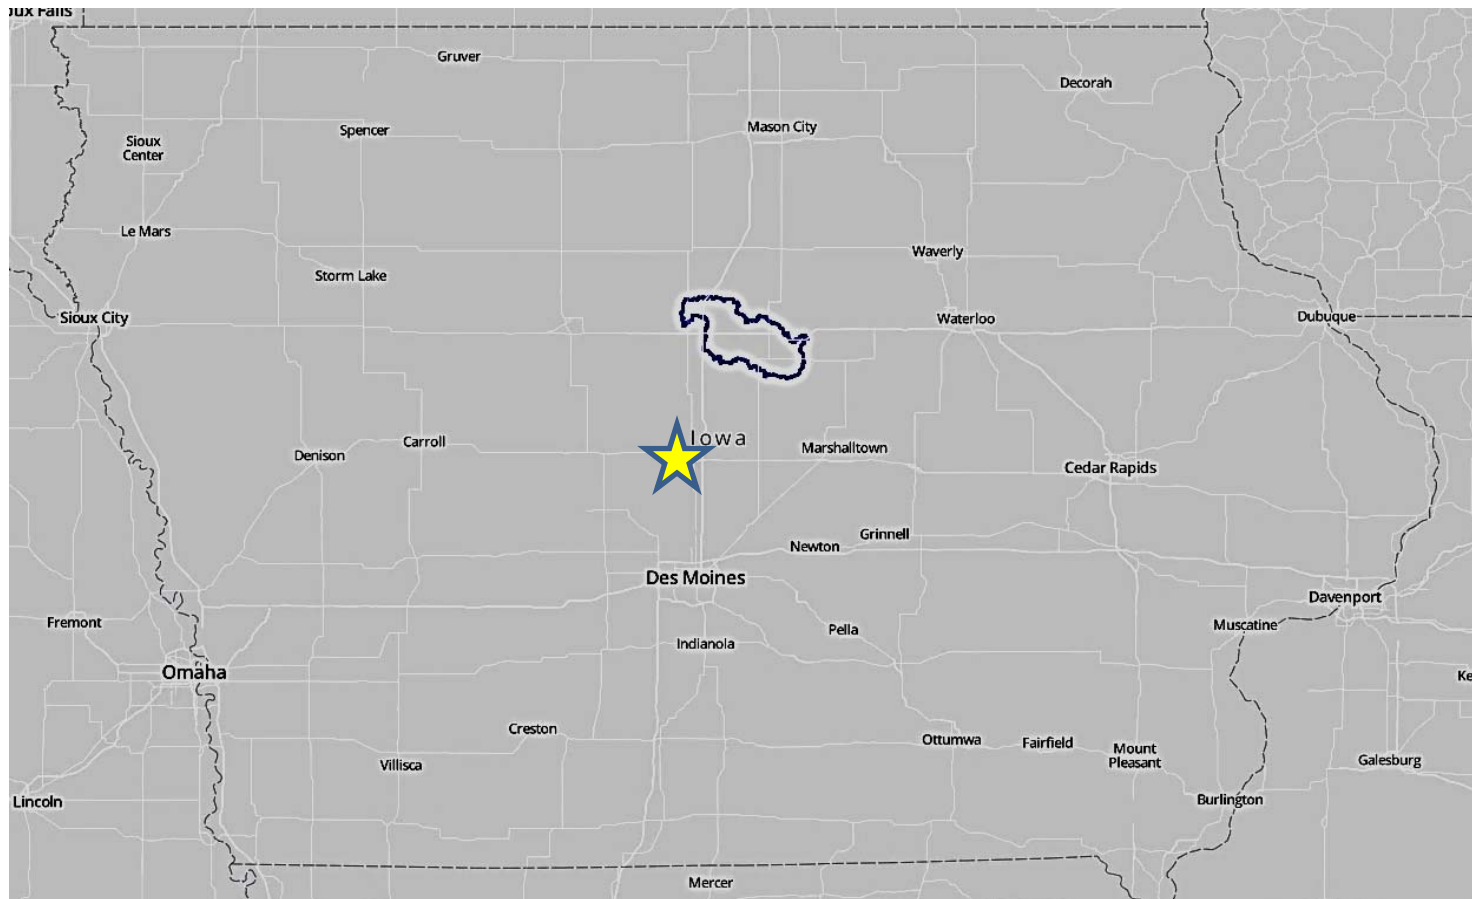

Soil Moisture Active Passive (SMAP)

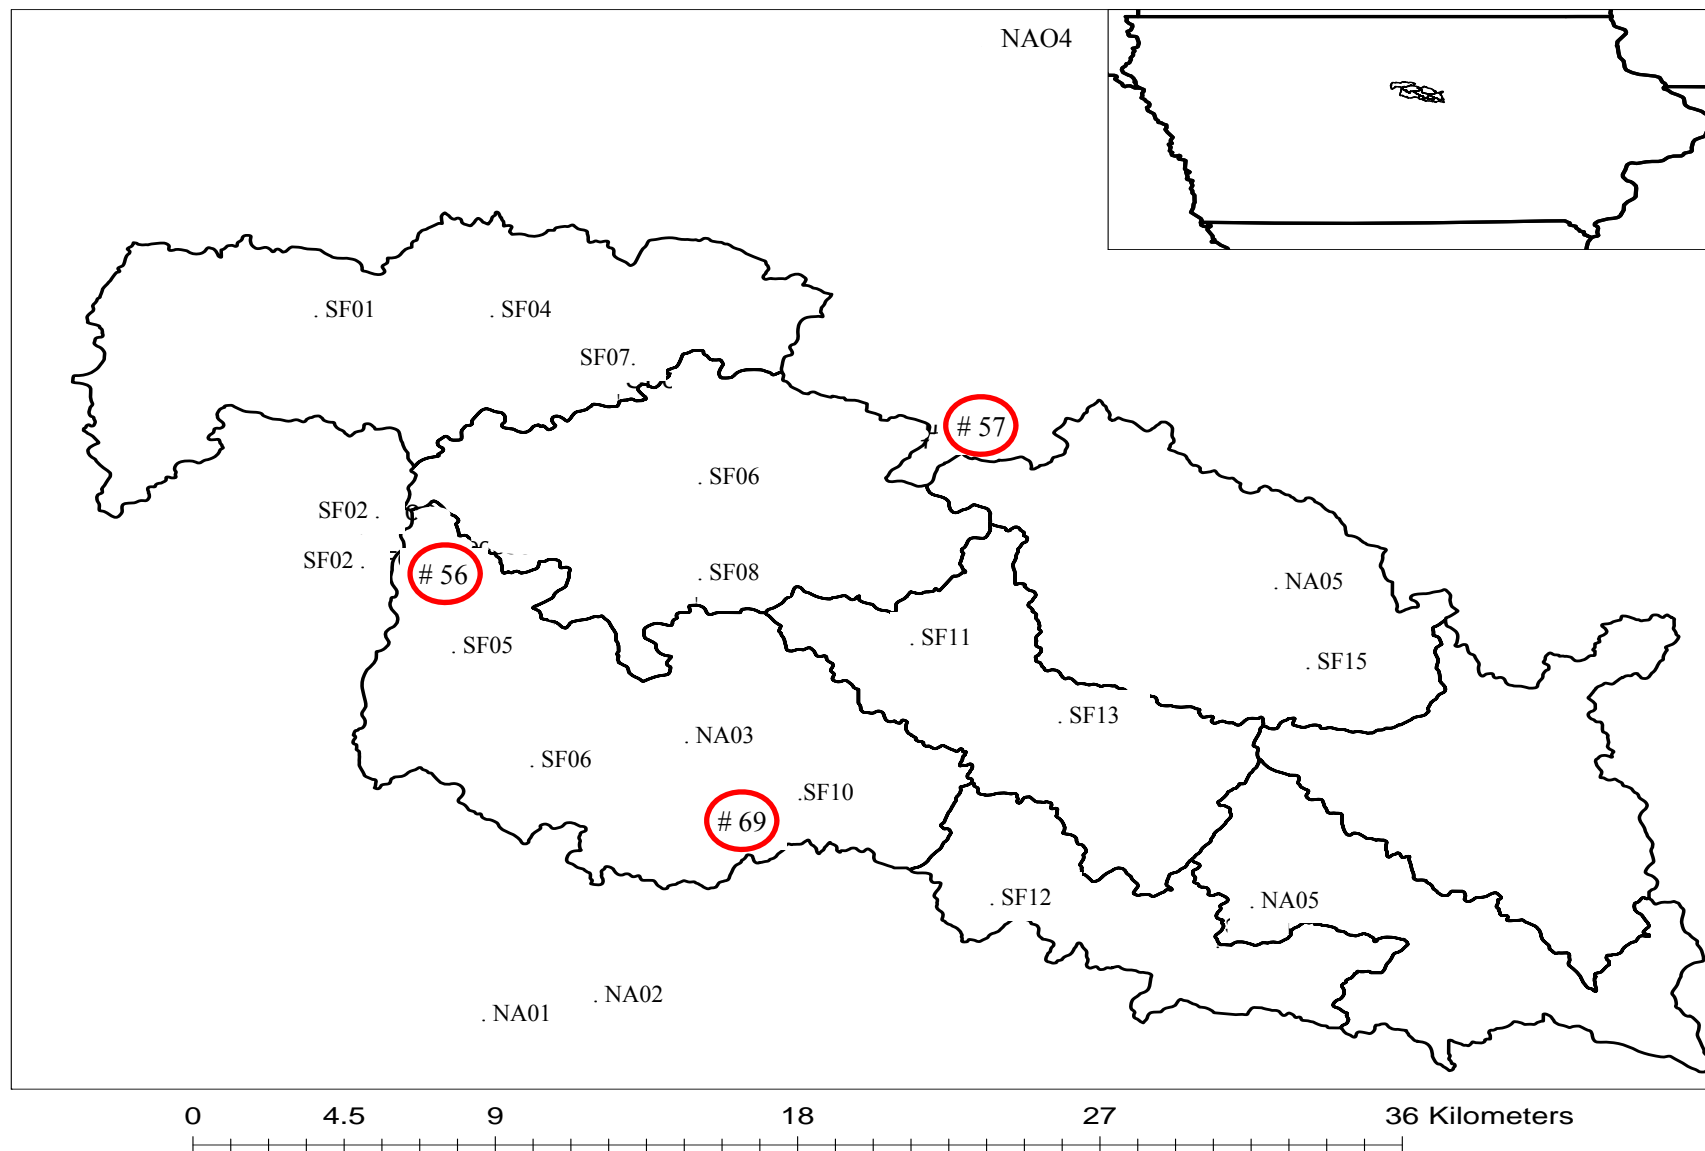

- November 2014
- NASA
- 2-3 Day Cycle
- Passive and Active

South Fork Watershed of the Iowa River

http://hrs1.arsusda.gov/awhite/crop_map.html

South Fork Stations

- 20 sites
- USDA and NASA
- Soil Moisture and Precipitation

Comparison of Current Instruments

- Soil Moisture and Ocean Salinity (SMOS) Satellite
- South Fork In-Situ Soil Moisture Network
- Characterize the Values

Hypothesis

- Soil Moisture Changes Observed by the SMOS Satellite Will be Different than the Soil Moisture Changes of the South Fork Soil Moisture Network.
- The SMOS Satellite Measurements Will Have More Variability than the South Fork Soil Moisture Network.

Methods

Soil Moisture through Time

Methods

Soil Moisture through Time

Numerical Analysis

- Exponential Fit

$$\hat{y} = Ae^{Bx} + C$$

- Rate of Soil Moisture Change

$$\frac{d\hat{y}}{dx} \approx AB e^{Bx}$$

- Residuals

$$residuals = y - \hat{y}$$

y = Observed Values

\hat{y} = Exponential Fit Values

Results

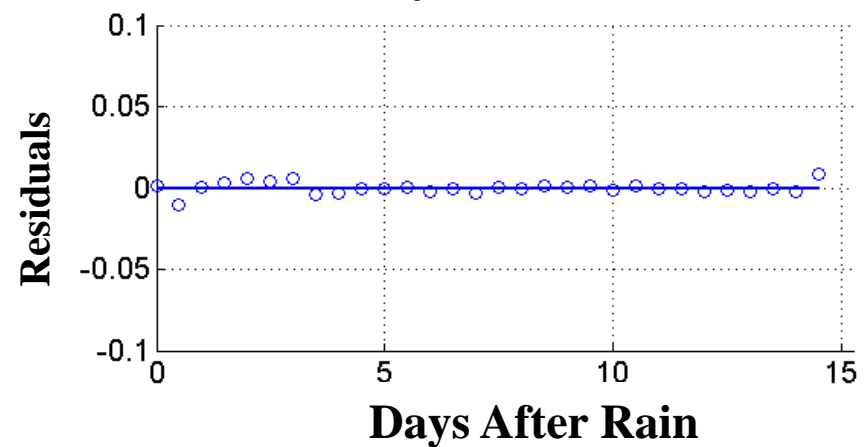

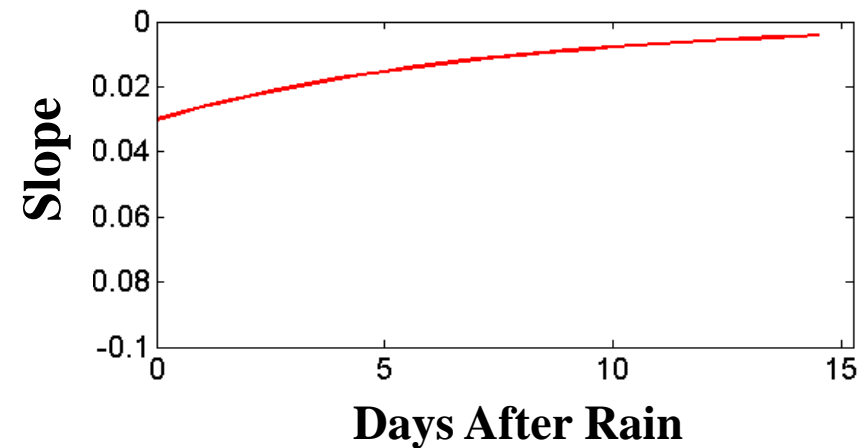

Case 2 (June 24th – July 10th)

Soil Moisture through Time

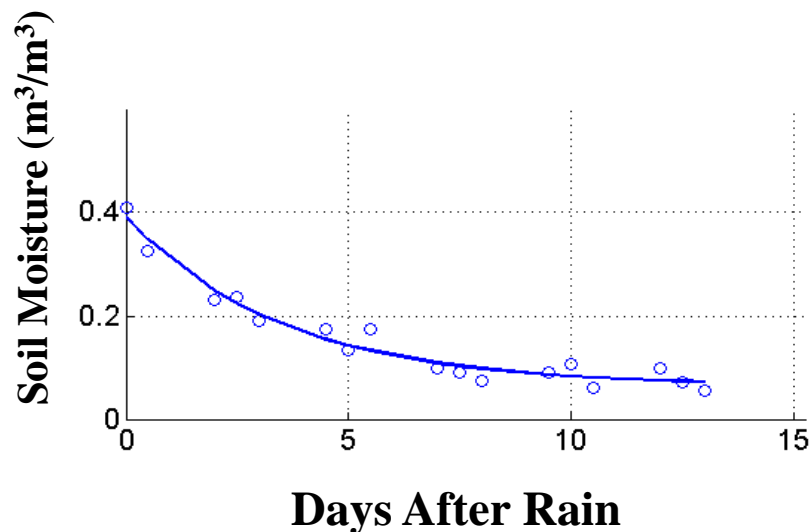

Case 2 (June 24th – July 10th)

South Fork

Case 2 (June 24th – July 10th)

Satellite

Numerical Analysis

Case 1	Slope (t=0)	Noise
Satellite	-0.121	0.028
South Fork	-0.042	0.008
Case 2	Slope (t=0)	Noise
Satellite	-0.093	0.019
South Fork	-0.030	0.003
Case 3	Slope (t=0)	Noise
Satellite	-0.074	0.021
South Fork	-0.020	0.004
Case 4	Slope (t=0)	Noise
Satellite	-0.040	0.020
South Fork	-0.018	0.002

Numerical Analysis

Case 1	Slope (t=0)	Noise
Satellite	-0.121	0.028
South Fork	-0.042	0.008
Case 2	Slope (t=0)	Noise
Satellite	-0.093	0.019
South Fork	-0.030	0.003
Case 3	Slope (t=0)	Noise
Satellite	-0.074	0.021
South Fork	-0.020	0.004
Case 4	Slope (t=0)	Noise
Satellite	-0.040	0.020
South Fork	-0.018	0.002

Conclusion

- Satellite Observed Faster Rates of Soil Drying than South Fork Sites
- Satellite Values More Variable
