

For the next three days, the packs were removed and the pony forced to stand in cold water for three hours daily.

When the pony was discharged on Aug. 20, 1950, the front feet were still slightly sore but he could walk with comparative ease and relatively less awkwardness.

The condition of laminitis is very common in Shetland ponies. This is often due to the way they are cared for. Since ponies are pets of the young generation, they are often fed and watered at the convenience of the youngster. This may be at noon one day and not until evening the next day. Sometimes they give the pony a little extra to make up for their laxity and to show their devotion. Often they are allowed too much water after a hard workout. This too may result in laminitis.

**Choke in a Horse.** On Aug. 10, 1950 a spotted gelding, age six years, was admitted to Stange Memorial Clinic with a history of being unable to swallow for a period of two or three weeks.

Upon examination an enlargement was noted in the upper jugular furrow. The mucous membranes were injected and icteric. The clinician was unable to pass a stomach tube. A diagnosis of choke was made.

An x-ray was taken of the esophagus. This revealed the esophagus to be greatly enlarged and full of feed. One half grain of apormophine was given intramuscularly but did not produce correction of the condition. A stomach tube was passed and water was pumped into the mass of feed, but the choke was not relieved. The horse was placed in a stall but no improvement occurred. The animal expired on Aug. 13, 1950.

Necropsy showed the immediate cause of death to be gangrenous pneumonia that had developed as a result of esophageal choke which caused foreign materials to enter or be aspirated into the lungs via the trachea. An ulcerative eso-

phagitis extended from a point approximately 6 in. posterior to the pharynx for some 12-15 cm. The cause of this was not determined.

Esophageal choke in the horse usually responds to treatment.

Spraying roosts, dropping boards, nests, and areas surrounding them with 1.5 percent Lindane, will control lice and mites in poultry houses, without tainting the eggs and flesh of the birds.

---

At the turn of the eighteenth century, turkeys were so valuable that banks in Connecticut and Massachusetts kept them on hand as part of their assets. Any farmer could deposit a turkey and walk out with silver money. *Turkey World* Aug. 1950.
