## INCREMENT BORINGS

With the establishment of adequate reproduction the time has come for the annual clear-cutting of one-fourth of the area of the productive Forestry Department.

As is evidenced by stout boles and many individuals with thin crowns, this stand is a bit older than those usually harvested in this area. Adverse growing conditions during the period 1941-1945 made this longer rotation period necessary.

This final volume, nurtured by necessary improvement cuts to remove inferior species and thinnings to eliminate poor desirables (especially those with impaired terminal buds), is being placed on the market. To the average buyer, these fully mature individuals should yield only high quality materials.

Since the material to be removed in this cutting cycle will be bought on the stump, it is only fair that some indication of soundness be given. These individual increment borings arranged on the following pages may help.
